

METHOD AND SYSTEM FOR VENDOR COMMUNICATION

ABSTRACT

A method and system for vendor communication is provided. The method and system allow management and documentation of the lifecycle of a contract that is outsourced to a vendor by and enterprise. Embodiments include a vendor communication software application ("VC" application) that centralizes documentation of communications between enterprise actors and vendor actors and any actions by any actor during execution of tasks associated with an outsourced package. The VC application provides a single point of input for information related to an outsourced package that can be used by the actors. Interactions with the VC application take place during the execution of the task in order to move the execution of the task forward, effectively forcing compliance with package requirements and the documentation of the same. The VC application is also compatible with legacy systems so that legacy data can be efficiently used. In one embodiment, the VC application is a hosted Internet application.
